Datetime strptime

March 6, 2023

datetime obj –> string (easy)

string —> datetime obj (not easy)

```
[1]: import datetime
```

```
[2]: datetime.timedelta(days=2).total_seconds()
```

```
[2]: 172800.0
```

```
[3]: d = datetime.datetime.now()

     d.strftime('%d/%B/%Y')
```

```
[3]: '06/March/2023'
```

```
[4]: string_obj = '06/March/2023'

     datetime.datetime.strptime(string_obj, '%d/%B/%Y')
```

```
[4]: datetime.datetime(2023, 3, 6, 0, 0)
```

```
[5]: d = datetime.datetime.now()

     d.strftime('Today\'s date is : %d/%B/%Y')
```

```
[5]: "Today's date is : 06/March/2023"
```

```
[6]: string_obj = "Today's date is : 06/March/2023"

     datetime.datetime.strptime(string_obj, 'Today\'s date is : %d/%B/%Y')
```

```
[6]: datetime.datetime(2023, 3, 6, 0, 0)
```

```
[7]: string_obj.rsplit(' ')[-1]
```

```
[7]: '06/March/2023'
```

```python
[8]: datetime.datetime.strptime(string_obj.rsplit(' ')[-1], '%d/%B/%Y')
```

```
[8]: datetime.datetime(2023, 3, 6, 0, 0)
```
